

UniConnect

Group 4 - Oscar Franco, Syed Mehdi, Syed Shaban, Dimitar Gjorgievski

The social media platform will have a basic home screen to display things such as profile page, calendar, discussion boards page, schedule, recommended connections, basic design - color schemes, pictures, and logos relevant to the user. This allows the user to quickly and easily access their courses, keep up with campus events, get to their student organizations or find new ones and connect with users who share similar interests.

It's crucial that the application is adaptable to both mobile and desktop. The application is for the use of students and their respective campus organizations. Since there is no university-mandated operating system or device, all people are free to choose their own operating systems.

Scenario "Basic Login Profile Setup"

The user launches the program and begins by creating an account if they are first time users. Otherwise, users login to their account using their email address and password.

Both the student and the organization will be allowed to select their profile picture from their computer/mobile device. The student can add their major and their enrolled courses as well.

Once a student has created their account, they will also have the ability to create a student organization page through an in-app profile builder. The user will be allowed to create an organization, input its name, description, and mission statement. The user who makes it is automatically an administrator. They will be able to make the org public/private, send invitations to other students, create posts and events.

Once inside the actual application the user will be greeted by their own personal home screen. It's important to note that each user's home page will be unique to them and will display information relevant to their interest, hobbies, courses, etc. However, all homepages will share the same core aspects. Many of these pages will be implemented later on as they extend into their own scenario, but for now we are just creating the general structure of how we want our project to look.

Each user will have a feed where they can scroll and see updates from their fellow friends and classmates, school updates, and events that happened/will happen on campus.

There will be a profile button where the user can go into their profile page to update their profile or review their page.

The calendar will allow the user to quickly look at their courses due assignments, class schedules, important dates like add/drop deadlines etc., and school events.

A section will be partitioned off to show recommended connections to the user such as other students on the platform who share interests like theirs, groups that members are friends with the user, or organizations the user could be interested in joining.

The user will also be able to more specifically look into a class by clicking on a drop down menu where the user will see a list of their enrolled courses and be able to switch between them to ask for help, answer questions their classmates might have or engage in any general discussions.

On the discussion board page users will click on the course they desired from their course list and view the discussions from that course. They will be able to talk to their classmates in their class about the curriculum, any general questions they may have about the subject, resources, links to relevant texts etc.

Students will also be able to do this with their student organization, and set up events that will link to their calendar
